

Aleksandr Takzhanov

System Analyst

Serbia Full-time: remote, hybrid, on-site; open to relocation mr.takzhanov@gmail.com telegram: @moodsouth

PROFILE

System Analyst with 6+ years of experience across business requirements, integrations, data and production infrastructure. I specialize in MDM platforms, microservice systems and API integrations: turning business needs into clear specifications, API contracts, data models and development-ready tasks. My strength is connecting business stakeholders, architects, developers, QA and operations from discovery to production-ready delivery.

TARGET ROLE

Interested in complex high-load products and platform teams where I can deepen systems analysis, work close to architecture, and grow toward solution architecture. Open to relocation.

CORE SKILLS

Analysis	Requirements discovery, functional/non-functional requirements, User Story, Use Case, business rules, error scenarios
Integrations	Airflow, REST API, gRPC, Kafka, KrakenD API Gateway, Swagger/OpenAPI, JSON, Postman
Data	MDM, database modeling, logical data modeling, entities, attributes, relationships, SQL, PostgreSQL, Redis, OpenSearch
Delivery	Jira, Confluence, Draw.io, Agile/Scrum, developer tasks, demos, acceptance, QA support
DevOps	Linux, Docker, Kubernetes/OpenShift, GitLab CI/CD, Jenkins, Ansible, Nginx, Prometheus, Grafana, ELK

EXPERIENCE

System Analyst

May 2023 - Apr 2026

AO Consult Plus - Fregat

Corporate MDM platform for centralized reference and master data management, data quality and integrations with internal systems.

- Led the MDM project from initial discovery to production release, keeping business goals, architecture constraints and delivery plan aligned.
- Defined the as-is/to-be process model and target system behavior, helping the team move from fragmented expectations to an agreed implementation plan.
- Worked through the external-integration layer built on Airflow: relational databases, Kafka queues and REST APIs, including loading, exchange, validation and error-handling scenarios.
- Contributed to the microservice architecture of the MDM system: 5+ services, asynchronous Kafka-based interaction and clear service boundaries.
- Worked through the API Gateway layer based on KrakenD: request routing, interaction contracts and a unified entry point for internal services.

- Built the product analysis base: business rules, functional requirements, API contracts, database model, validation logic and error scenarios.
- Coordinated designers, QA engineers and developers, synchronizing UX flows, specifications, test cases, demos and acceptance before release.

DevOps Engineer

Sep 2019 - Sep 2022

Sber

Corporate system "Senat" for supporting management decisions of bank executives. Project team - 30+ people.

- Deployed and supported high-load services in a banking environment, administering Linux/Windows servers.
- Configured CI/CD processes and automated application delivery, working with containers and orchestration.
- Maintained monitoring, reliability and operational readiness of services.
- Supported development teams on infrastructure topics, strengthening end-to-end understanding of the requirements lifecycle from analysis to production.
